
High-resolution Hurricane Reanalysis and Reforecasts using state-of-art operational HWRF model

Zaizhong Ma and Avichal Mehra

02/16/2017

Motivation

COASTAL Act:

The Consumer Option for an Alternative System to Allocate Losses Act was signed into law on July 6, 2012.

Purpose:

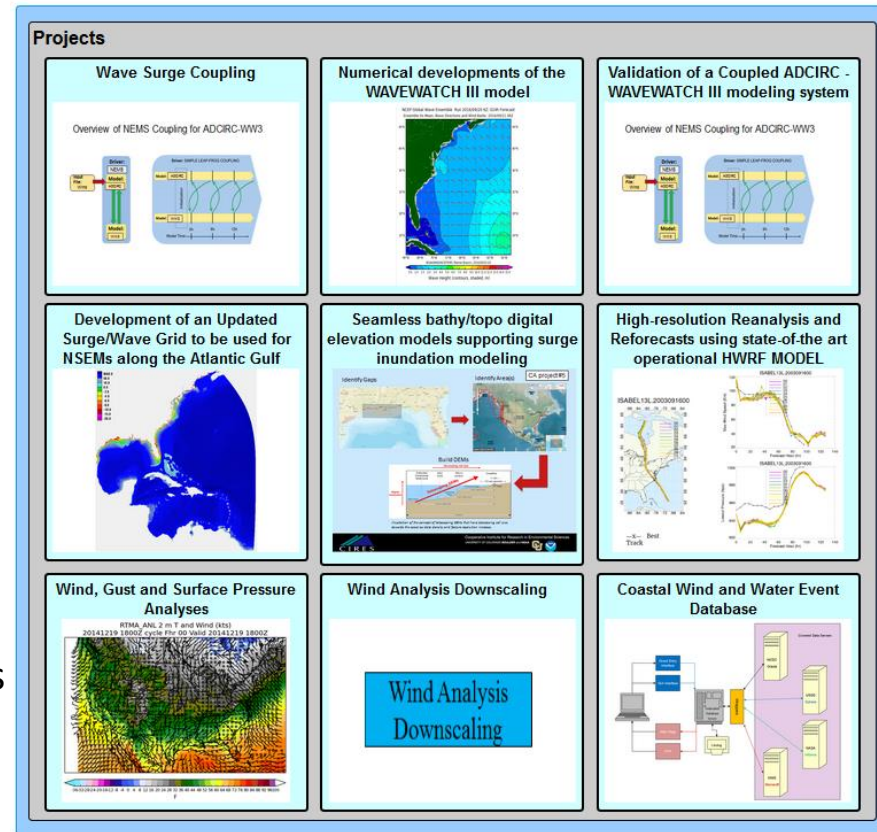

To lower costs to FEMA's National Flood Insurance Program (NFIP) by better discerning wind versus water damage in the case of "indeterminate losses."

(website: <http://www.weather.gov/sti/coastalact>)

Require:

NOAA to produce detailed "post-storm assessments" in the aftermath of a damaging tropical cyclone that strikes the U.S. or its territories.

COASTAL Act Component Projects

Role of HWRF in the COASTAL Act

- ❖ **Requires** a time history of mean wind, wind gust, surface pressure and air-sea temperature difference (atmospheric stability, AS) over the area impacted by a **land falling tropical cyclone** in order to estimate the strength and timing of damaging winds and also to force wave and surge models.
- ❖ **Provide** the background fields while Un-Restricted Mesoscale Analysis (URMA) will perform the mean wind, gust, and surface pressure and AS analyses.

Working Plan

- **Year-1:**
 - Design deterministic and ensemble runs with the latest version of the operational HWRF.
 - Make preliminary deterministic and ensemble runs at the highest possible resolution for the chosen storms.
- **Year-2:**
 - Fine tune model configurations to produce more accurate hurricane analysis products
 - Work with downscaling and downstream applications (forcing ocean, wave, land, surge and inundation models) to generate products for selected landfalling storms that impacted US coastal regions.

Milestones

- Data Collection:
 - GFS Forecasts: 2.5deg Reanalysis & 1.0deg GEFS (not every day archived on HPSS)
 - Observations: conventional, satellites, TDR, and High Density Observation (HDOB) data
- Ensemble inputs generation for GSI hybrid data assimilation
- Experimental design:
 - NO DA, No ocean
 - + Single cycle
 - + Entire storm
 - DA-hybrid, ocean
 - + Single cycle
 - + Entire storm
- Prepare adequate validation and verification packages/tools to be used with available observations.

Case study with IKE

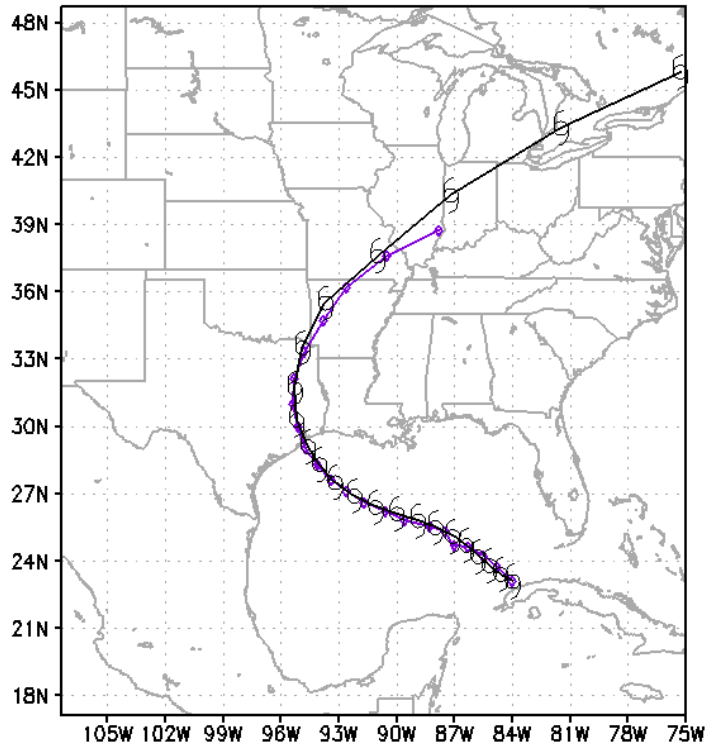

— — single cycle test

- **Single cycle**: 2008091000
- **HWRF System**: MergeH216
- **GFS input**: 2p5 deg, download from HPSS history archive data
- **Observations**: conventional and satellite available on HPSS
- **Experiment setup**:
 - **run_gsi=no** ;; GSI and FGAT initialization
 - **run_ocean=no** ;; POM coupling
 - ocean_model=POM ;; Selected ocean model: POM or HYCOM
 - atmos_model=WRF ;; Selected atmospheric model. Must be WRF
 - **run_wave=no** ;; Wave coupling?
 - wave_model=WW3 ;; Which wave model? Must be WW3
 - run_relocation=yes ;; vortex relocation
 - run_ensemble_da=yes ;; run the DA ensemble
 - run_ens_relocation=no ;; run relocation for ensemble members
 - run_satpost=yes ;; make synthetic satellite products
 - run_multistorm=no ;; run as a Multi Storm (even if 1 or No storms)

HWRF output into Storm Surge Model Hindcast

Storm Surge Model Setup

- ADCIRC-based modeling system
- Non-linear dynamics, tide and surge interaction, inland flooding
- Uncoupled (no waves, no rivers)
- HSOFS grid (~200m at the coast), covers the entire US East Coast
- Atmospheric forcing: HWRF fields, taken from RDHPCS tape
Types: /NCEPDEV/nesdis-jcsda/1year/Zaizhong.Ma/hwrf/ike_CTL
- Initial water level offsets:
 - +0.14 m (climatology-based)
 - +0.06 m (data-based)

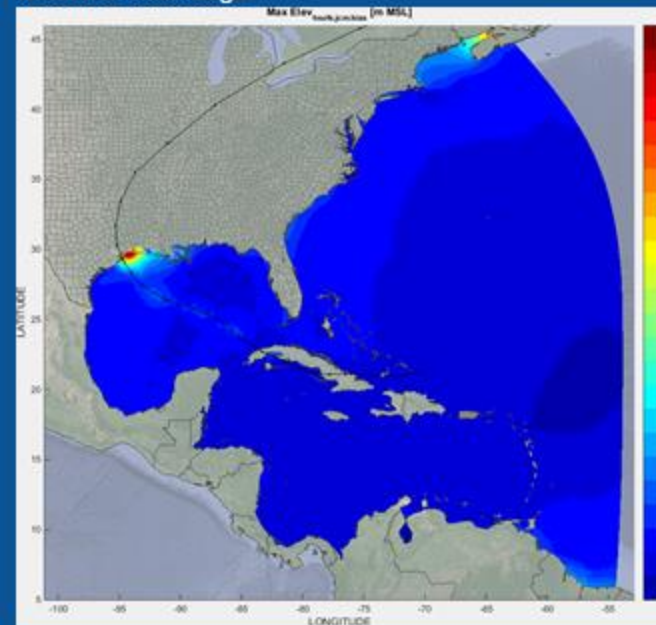

HSOFS grid coverage

Case study with IKE

— — Entire Storm Test

- **Period**: 1-14, September 2008
- **HWRF System**: MergeH216, still no DA, no ocean
- **GFS input**: 2p5 deg, downloaded from HPSS history archive data
- **Status**: Experiments for entire period haven't completed on Theia yet, just finished for 1-6, September.
- **Preliminary Results** just focus on track, intensity and etc.

Next steps...

- Hurricane IKE:
 - Complete the Control experiments for IKE: No DA, No Ocean and 2p5 GFS
 - Perform DA experiments:
 - Generate ICs for DA hybrid, turn on the DA option
 - Turn on the Ocean option
 - Test GEFS (1.0 deg)
- Update HWRF system once FY17 configuration is finalized.
- Data Denial experiments
- Explore generation of ensembles
- Work on the other two land-falling Hurricanes (2003 Isabel and 1992 Andrew).
- Post-storm Assessments.
- Provide HWRF output to whole working group for COASTAL Act.
