# OVERVIEW

- Operational EPS in NMC
- Application of EPS Products in NMC
- Research on Application of EPS
- Plans

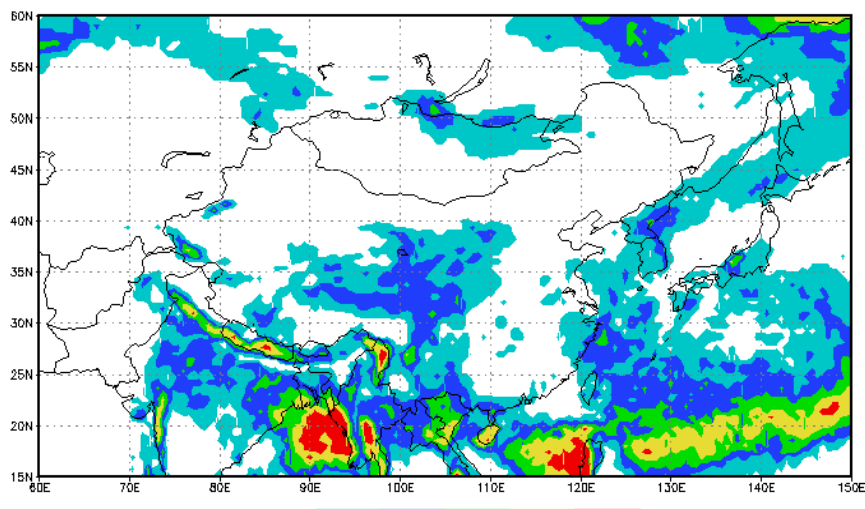

# 1 Operational EPS in NMC

<b>T213 Global Ensemble System</b>	
Resolution	640*321
Initial uncertainty	Breeding vector
Initial uncertainty Model uncertainty	None
Daily frequency	00、06、12 and 18UTC
Perturbed members	14 members for each cycle
Forecast length	10 days(240 hours)
Implementation	2006
Output	24 hourly

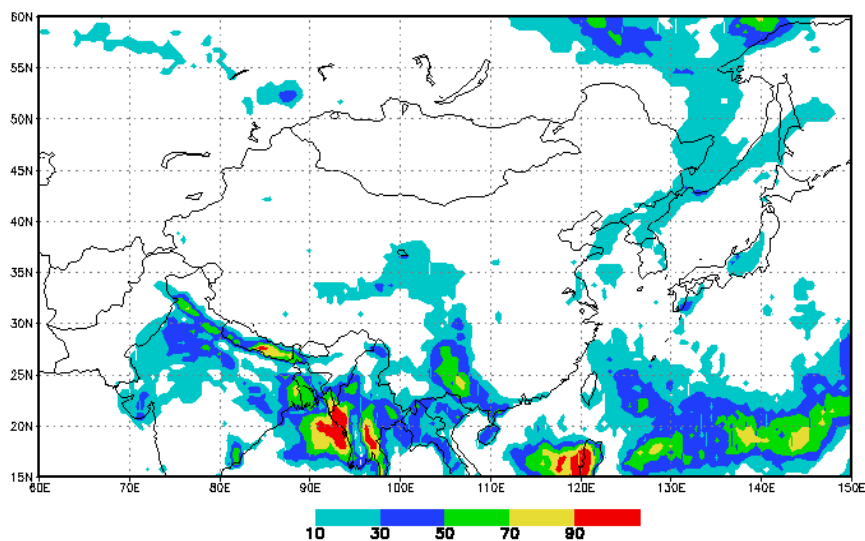

## 2 Application of EPS Products in NMC

EPS-T213 Prob total rainip >10.0mm 96H fcst from 12Z 18 AUG 2006

EPS-T213 Prob total rainip >10.0mm 72H fcst from 12Z 18 AUG 2006

S-T213 500mb ht(m) 568 and 588m Spgt 240H fcst from 12Z 13 MAY 2006

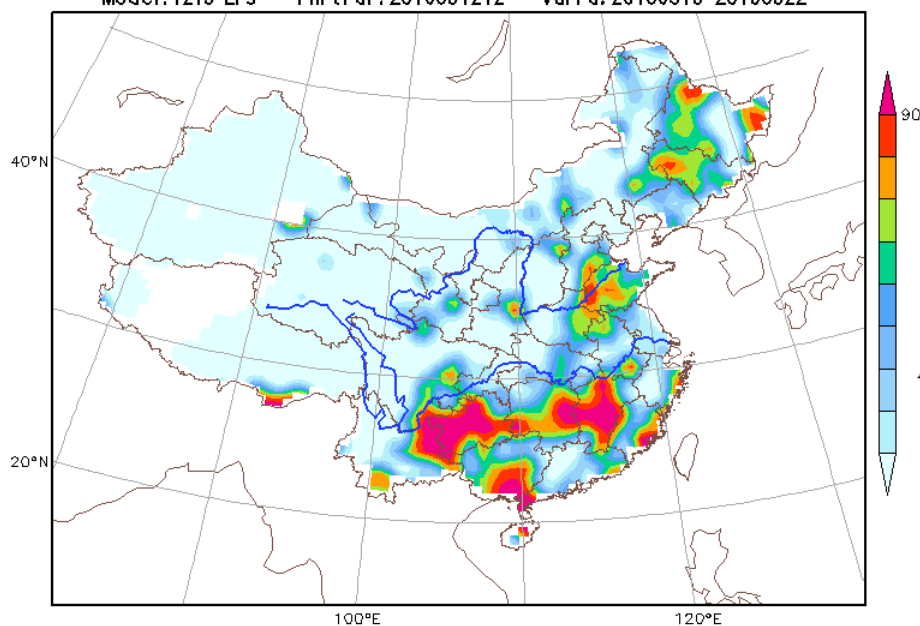

## 2 Application of EPS Products in NMC

### The probability of the mean temperature(0-240h) above normal

1-10 天平均气温距平 $\geq 0^{\circ}\text{C}$  概率预报

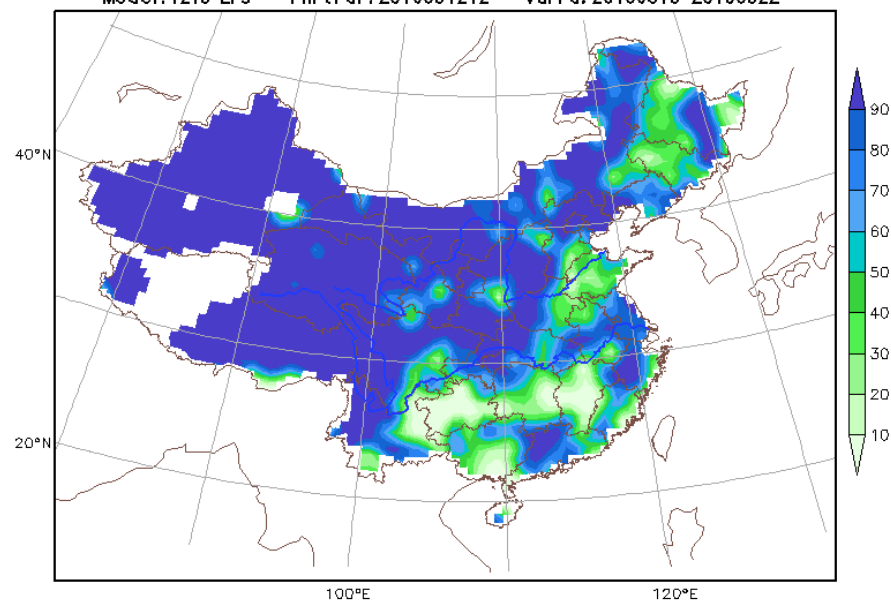

Model: T213-EPS Initial: 2010051212 Valid: 20100513-20100522

### The probability of the mean temperature(0-240h) below normal

1-10 天平均气温距平 $< 0^{\circ}\text{C}$  概率预报

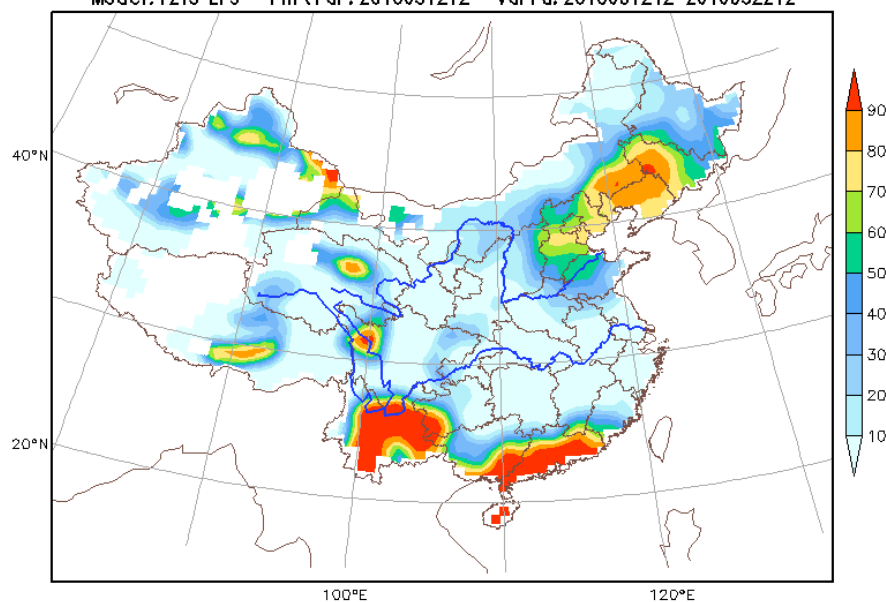

Model: T213-EPS Initial: 2010051212 Valid: 20100513-20100522

## 2 Application of EPS Products in NMC

0-240 小时累计降水量距平百分率 < 0% 概率预报

Model: T213-EPS Initial: 2010051212 Valid: 2010051212-2010052212

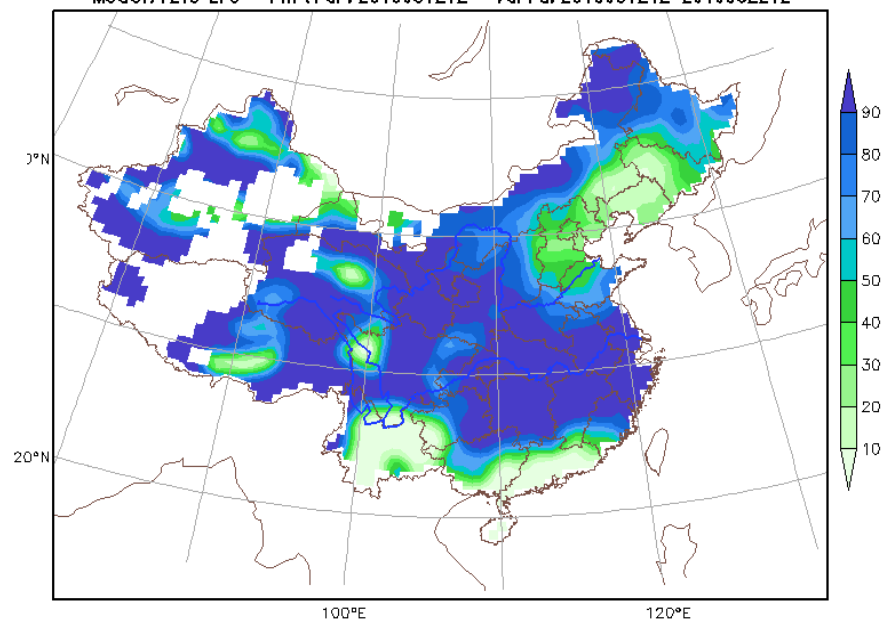

**The probability of the accumulated precipitation(0-240h) below normal**

**The probability of the accumulated precipitation(0-240h) above normal**

0-240 小时累计降水量距平百分率 ≥ 0% 概率预报

Model: T213-EPS Initial: 2010051212 Valid: 2010051212-2010052212

## 2 Application of EPS Products in NMC

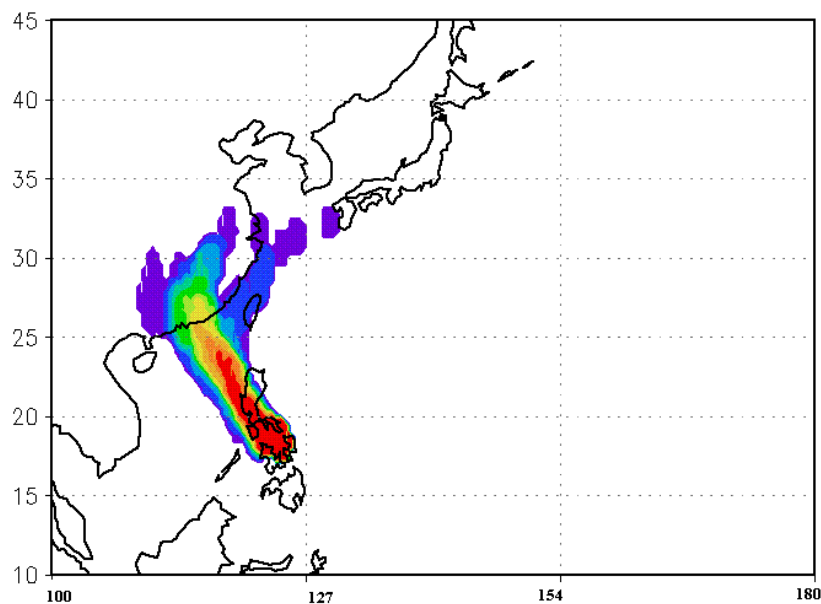

Westerly index of northern hemisphere( analysis + 10days forecast)

## 2 Application of EPS Products in NMC

Probability that TC(806) will pass within 120km radius  
During 120h integration based 2008062012 UTC

**Pass Probability Prediction**

Tracks from TC-EPS,  
120h integration based on 2008062012 UTC  
Black:EPS members; Orange:Control; Green:Mean

**Track Ensemble Prediction**

# 3 Research on The Application of TIGGE DATA

## One of three TIGGE data archive centers

Research Project: The application technology for TIGGE data(2007-2009)

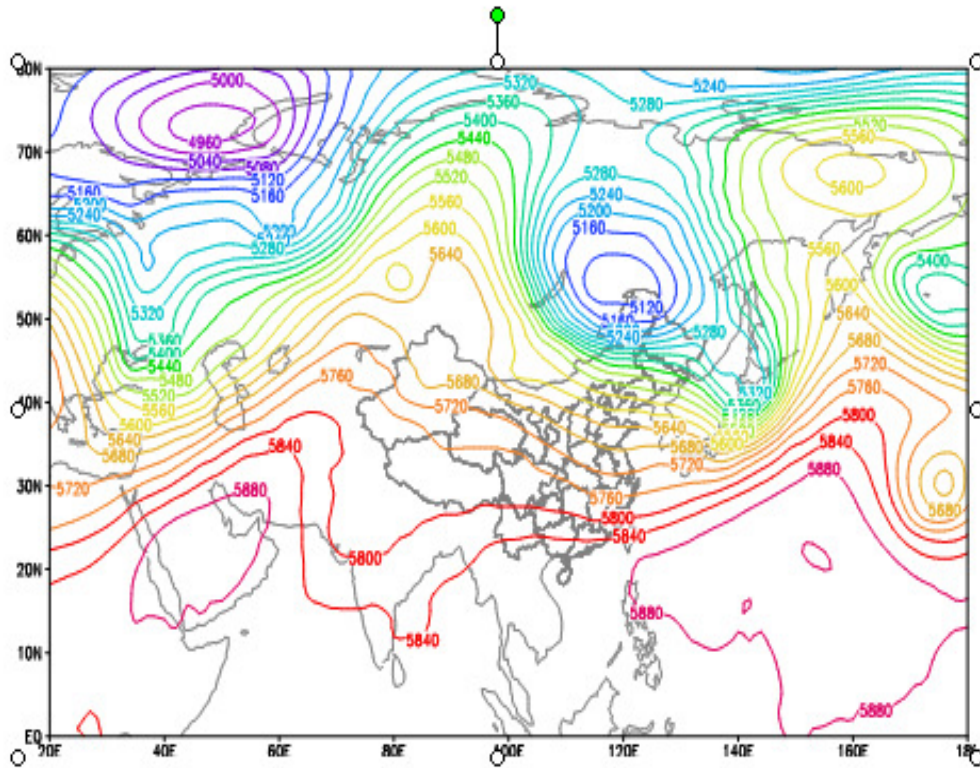

THORPEX Interactive Grand Global Ensemble

The Observing System Research and Predictability Experiment

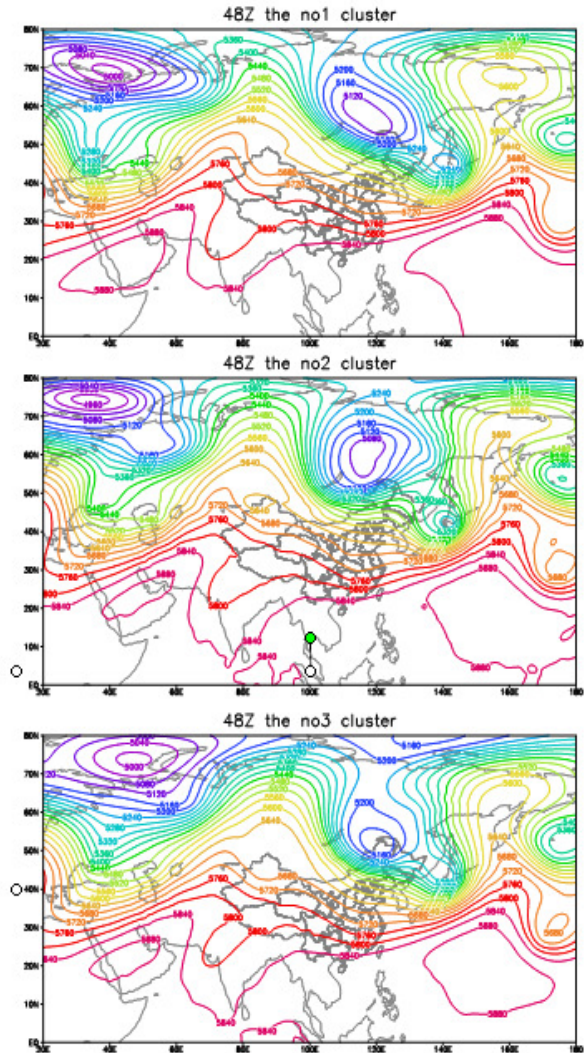

国家气象中心  
NATIONAL METEOROLOGICAL CENTER

# 3.1 Research: Cluster Method

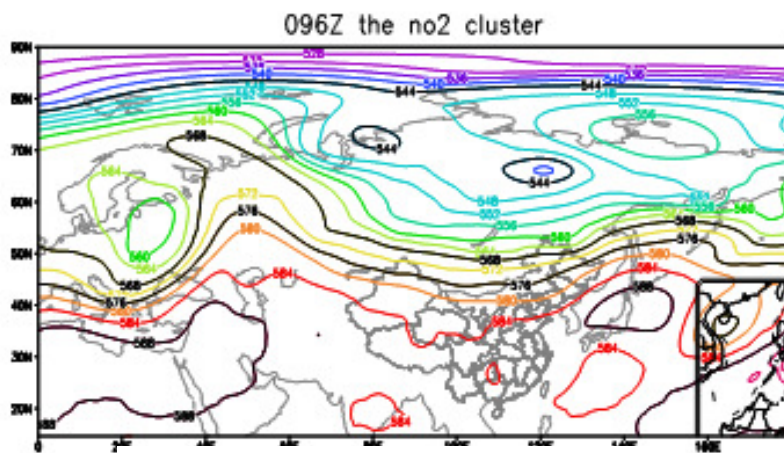

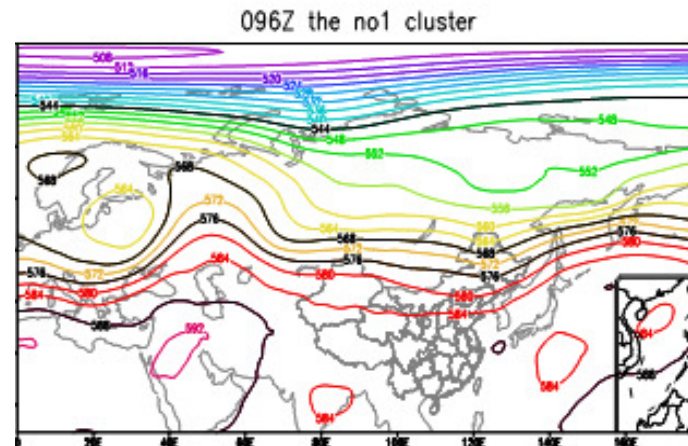

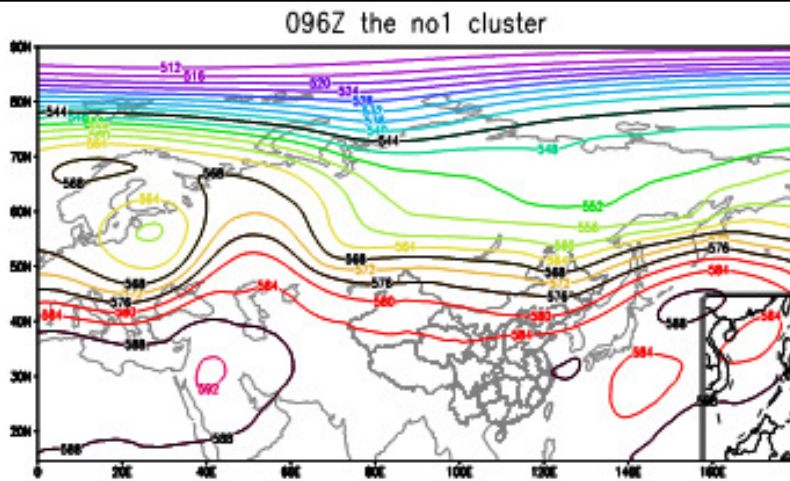

*NCEP analysis on 12UTC 7th Nov 06.*

**The probability of the three groups are 40.0%、 6.7%、 53.3%**

### 3.1 Research: Multi Model Cluster after bias correction

before bias correction

after bias correction

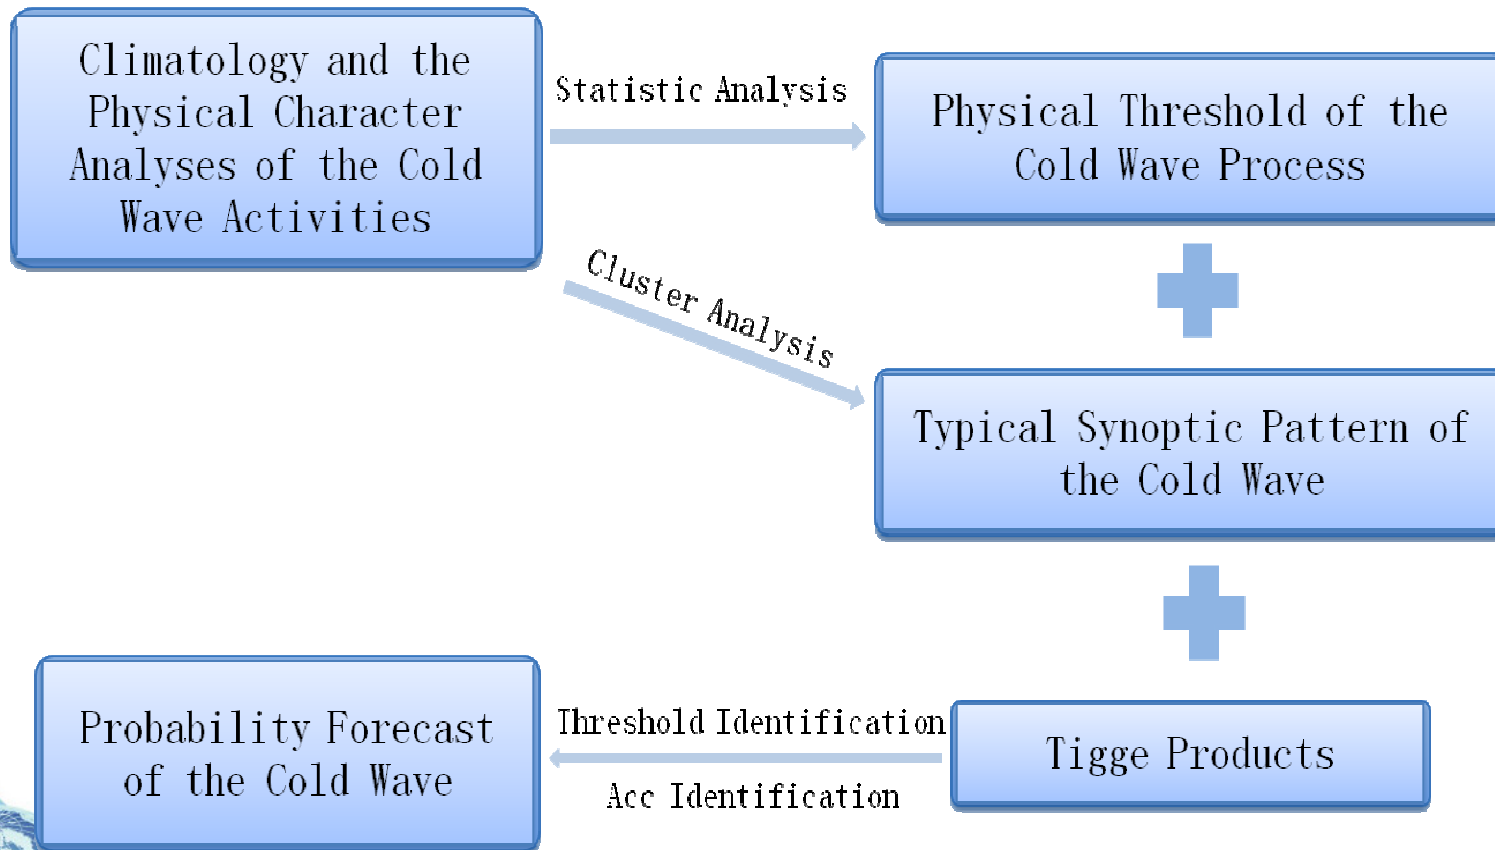

Bias Correction :

$$\text{Decaying averaging mean error} = (1-w) * \text{prior t.m.e} + w * (f - a)$$

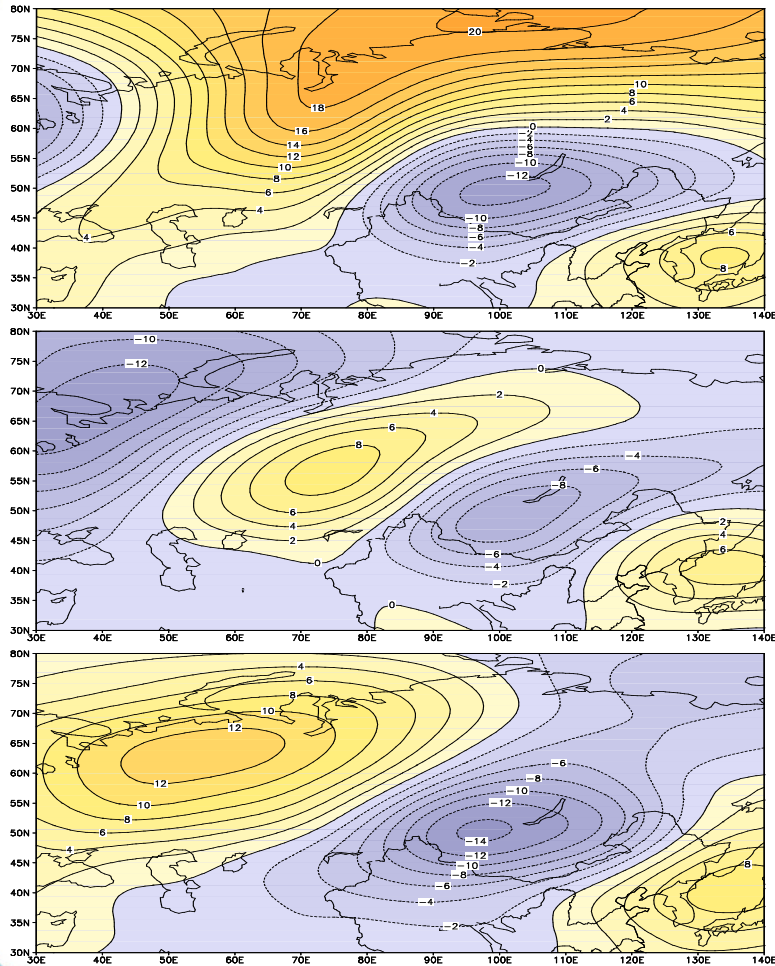

## 3.2 Automatic Identification Forecast for Cold Wave in China

### Framework

## 3.2 Automatic Identification Forecast for Cold Wave in China

Different objective cluster methods have been made on 87 cold wave processes among 56 years to get the typical patterns .

we found that the cluster based on the abnormal field of the 500hPa not only helps to reduce the influence of the seasonal variety but also gives prominence to the circulation disturbance under which the cold wave happens. The cluster analysis result in three typical abnormal distributions of cold wave: zonal plus-minus-plus distribution, meridional minus-plus-minus and plus-minus-plus distribution. An objective cold wave forecast model is finally established based on the typical synoptic pattern and the thresholds of physical character during the cold wave process.

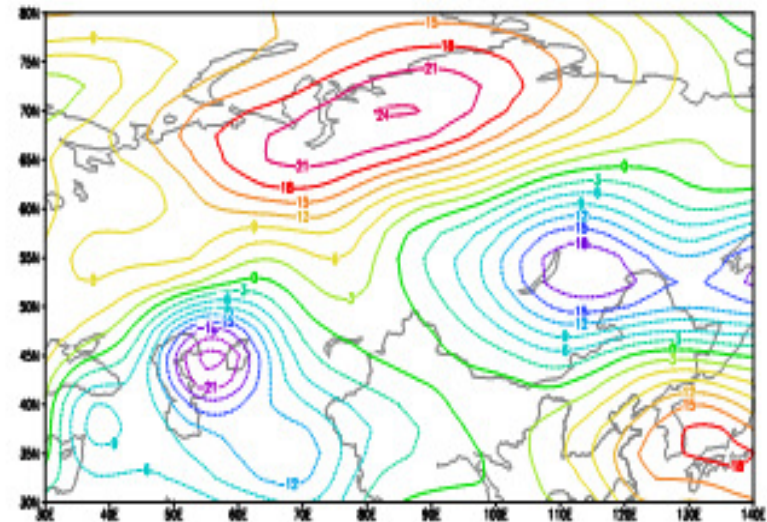

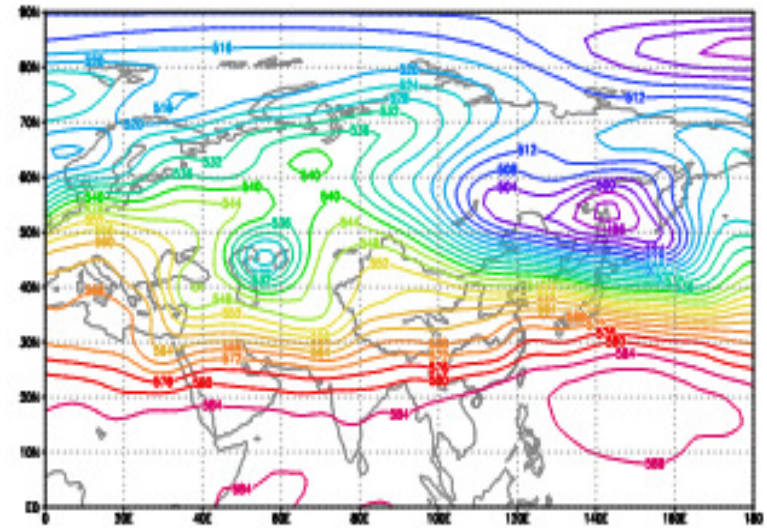

**Three typical 500hPa Anomaly Distributions of Cold Wave in China**

## 3.2 Automatic Identification Forecast for Cold Wave in China

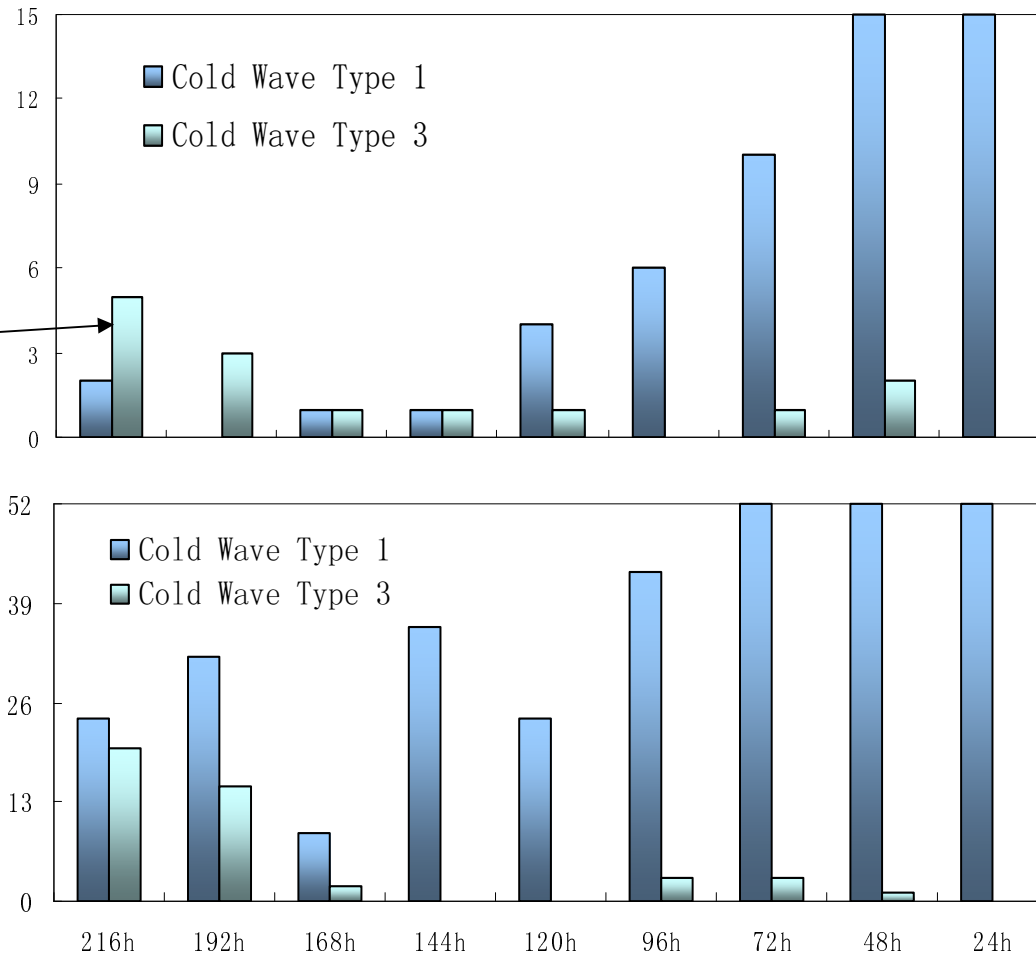

10 January 2008

## 3.2 Automatic Identification Forecast for Cold Wave in China

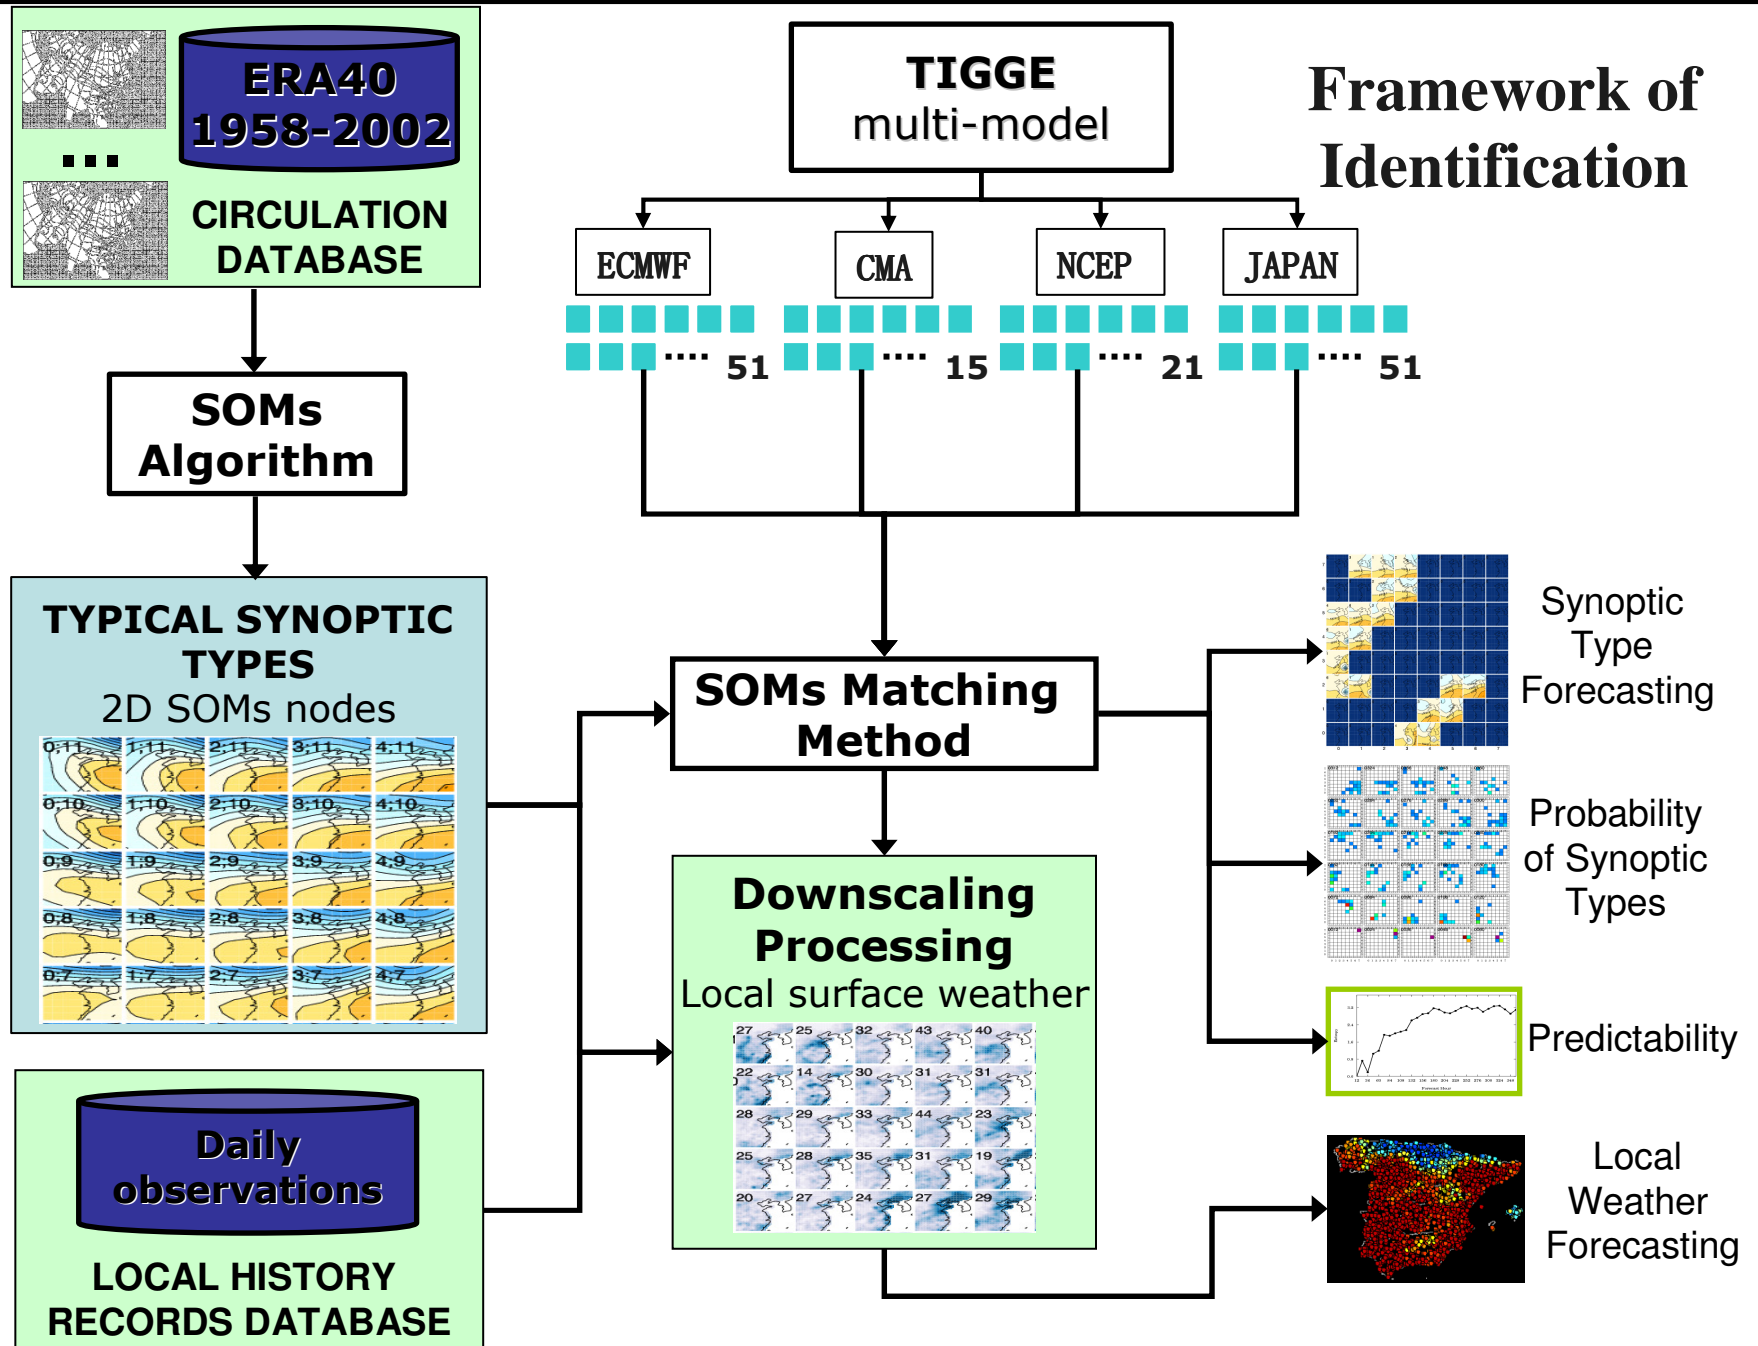

Numbers of the Ensemble Members that Forecast the Cold Wave

Forecast Result for the Cold Wave of 10 January 2008 based on the NMC&ECMWF Ensemble Products

### 3.3 Identification of Typical Weather Events in Summer over China

### 3.3 Identification of Typical Weather Events in Summer over China

**Typical synoptic types are identified from historical circulation data using SOMs method**

ERA40 Reanalysis Data :

- Period: 1958-2002 summer (June, July, August)
- Region: Eastern China ( $110\sim 130^{\circ}$  E,  $20\sim 40^{\circ}$  N)
- Field: daily 500mb height

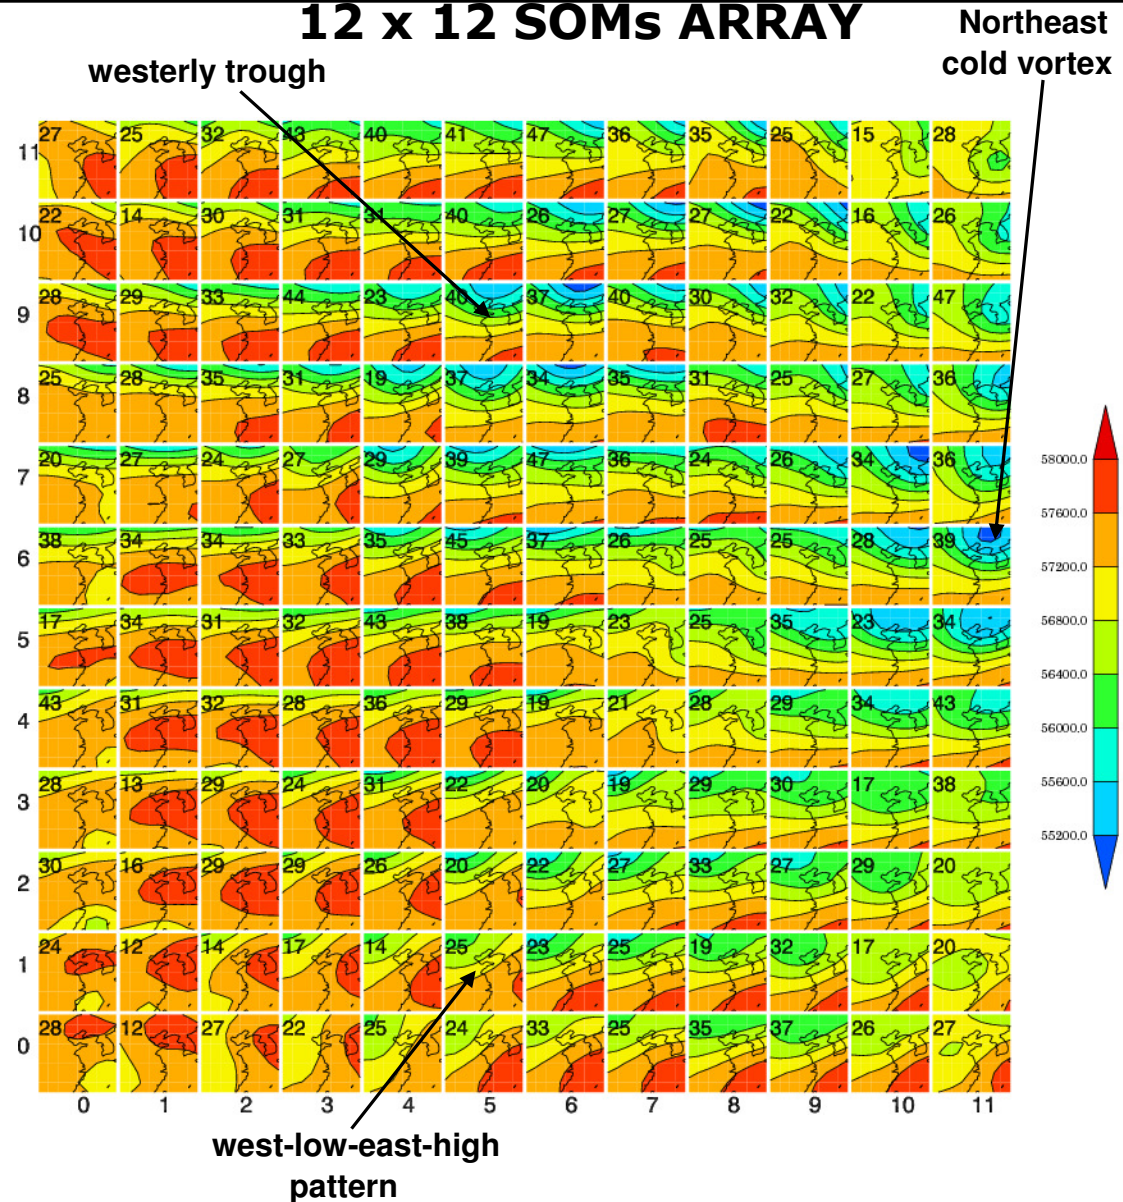

### 3.3 Identification of Typical Weather Events in Summer over China

#### TYPICAL SYNOPTIC TYPES

#### 12 x 12 SOMs ARRAY

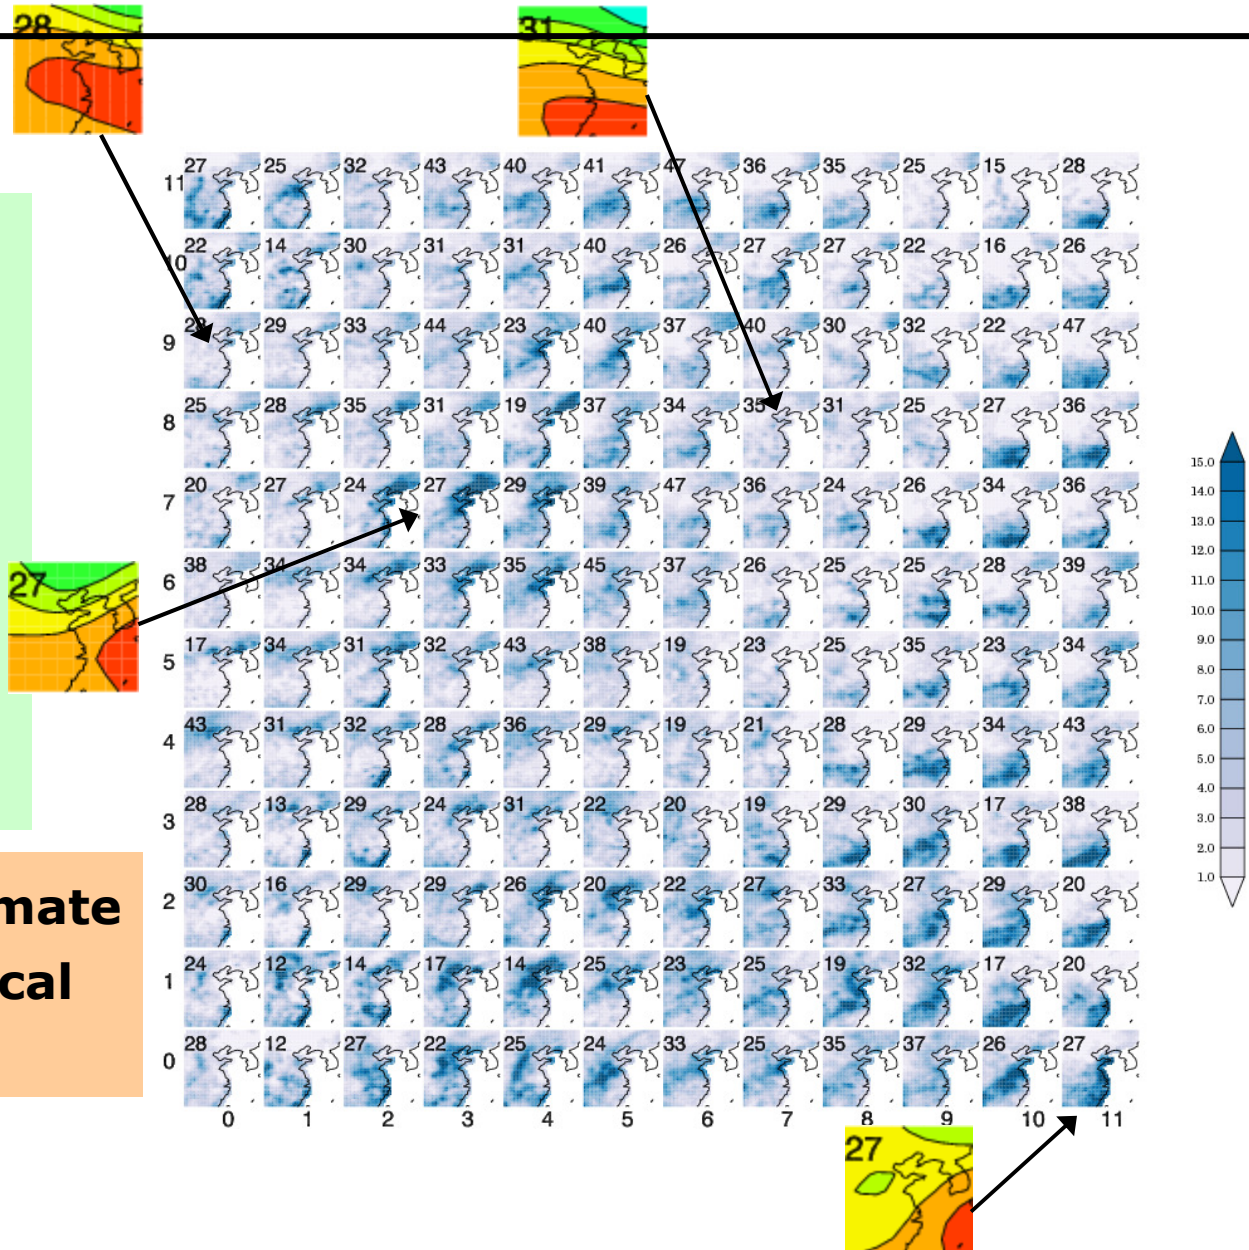

- Each node represents a typical synoptic weather type
- Synoptic types are spread in a continuum across the 2D node space
- Divided into two groups: subtropical high and midlatitude synoptic system
- Similar synoptic types are located adjacent to one another, while dissimilar types are at opposite extremes:
  - At the top left corner, subtropical high is dominant
  - At the top right corner, extratropical cyclone is dominant
  - At the lower left corner, tropical cyclone is dominant
  - At the lower right corner, southwest vortex is dominant

### 3.3 Identification of Typical Weather Events in Summer over China

- Less rainfall nodes are found in the upper left, upper right and central parts of SOMs array, corresponding to continental high or subtropical ridge types
- More rainfall nodes are distributed in the upper center and right lower portions, associated with westerly trough or cyclone synoptic types

**Local precipitation climate associated with typical synoptic types**

### 3.3 Identification of Typical Weather Events in Summer over China

---

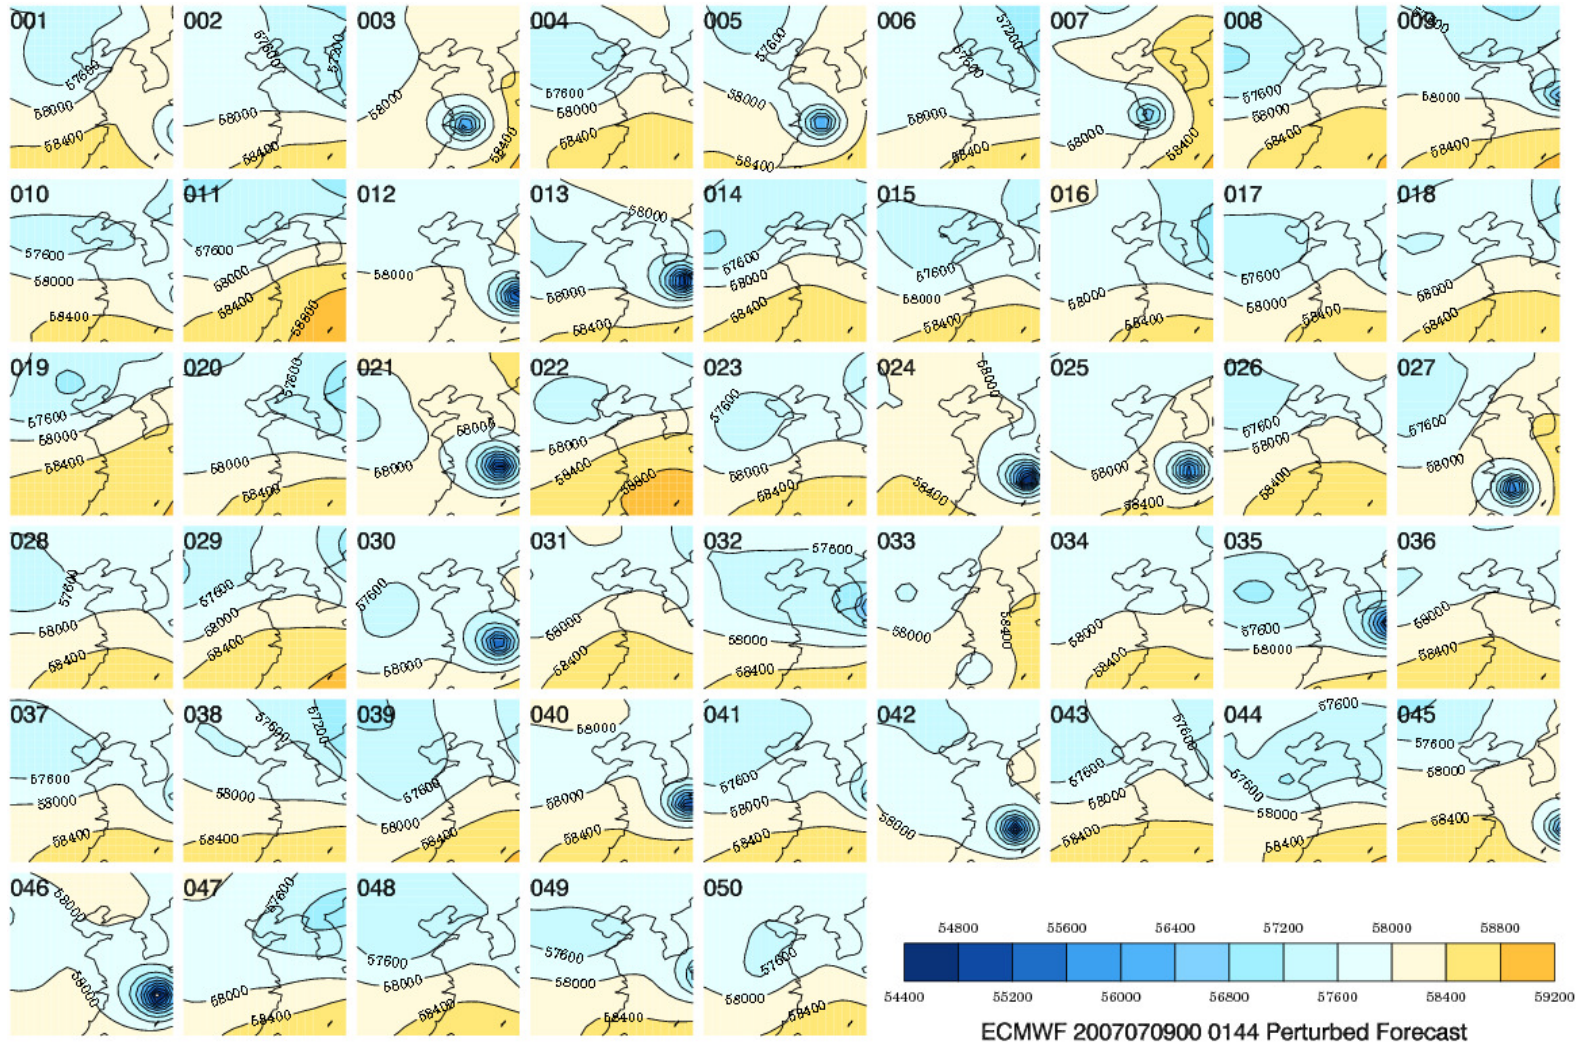

#### Case study:

Using the obtained 144 types as the basic patterns, typical weather events are identified from TIGGE ensemble products. Case study for verification :

- ECMWF ensemble products: 50 perturbed members
- Run time: 00:00UTC, 9th July,2007
- Lead time: 012h、 024h、 ...、 360h

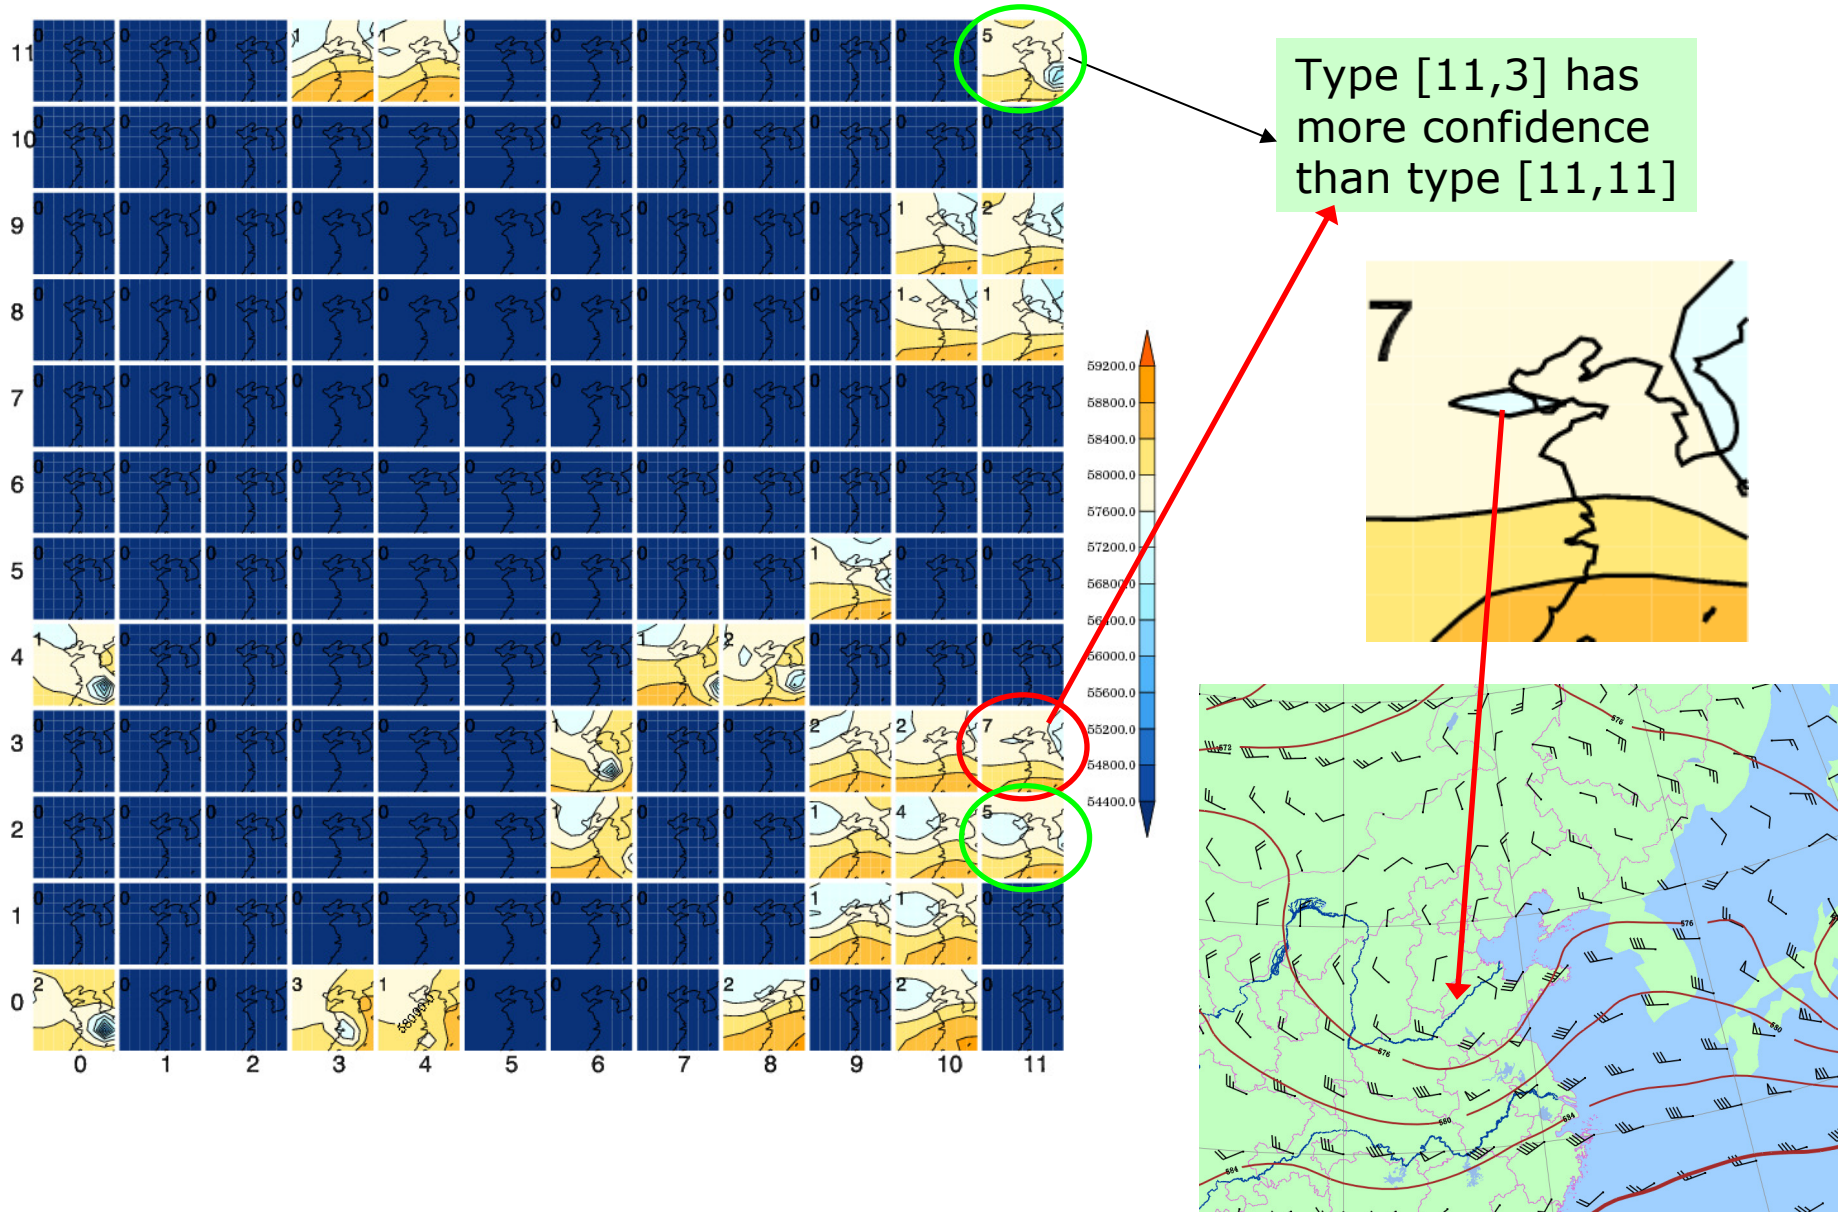

### 3.3 Identification of Typical Weather Events in Summer over China

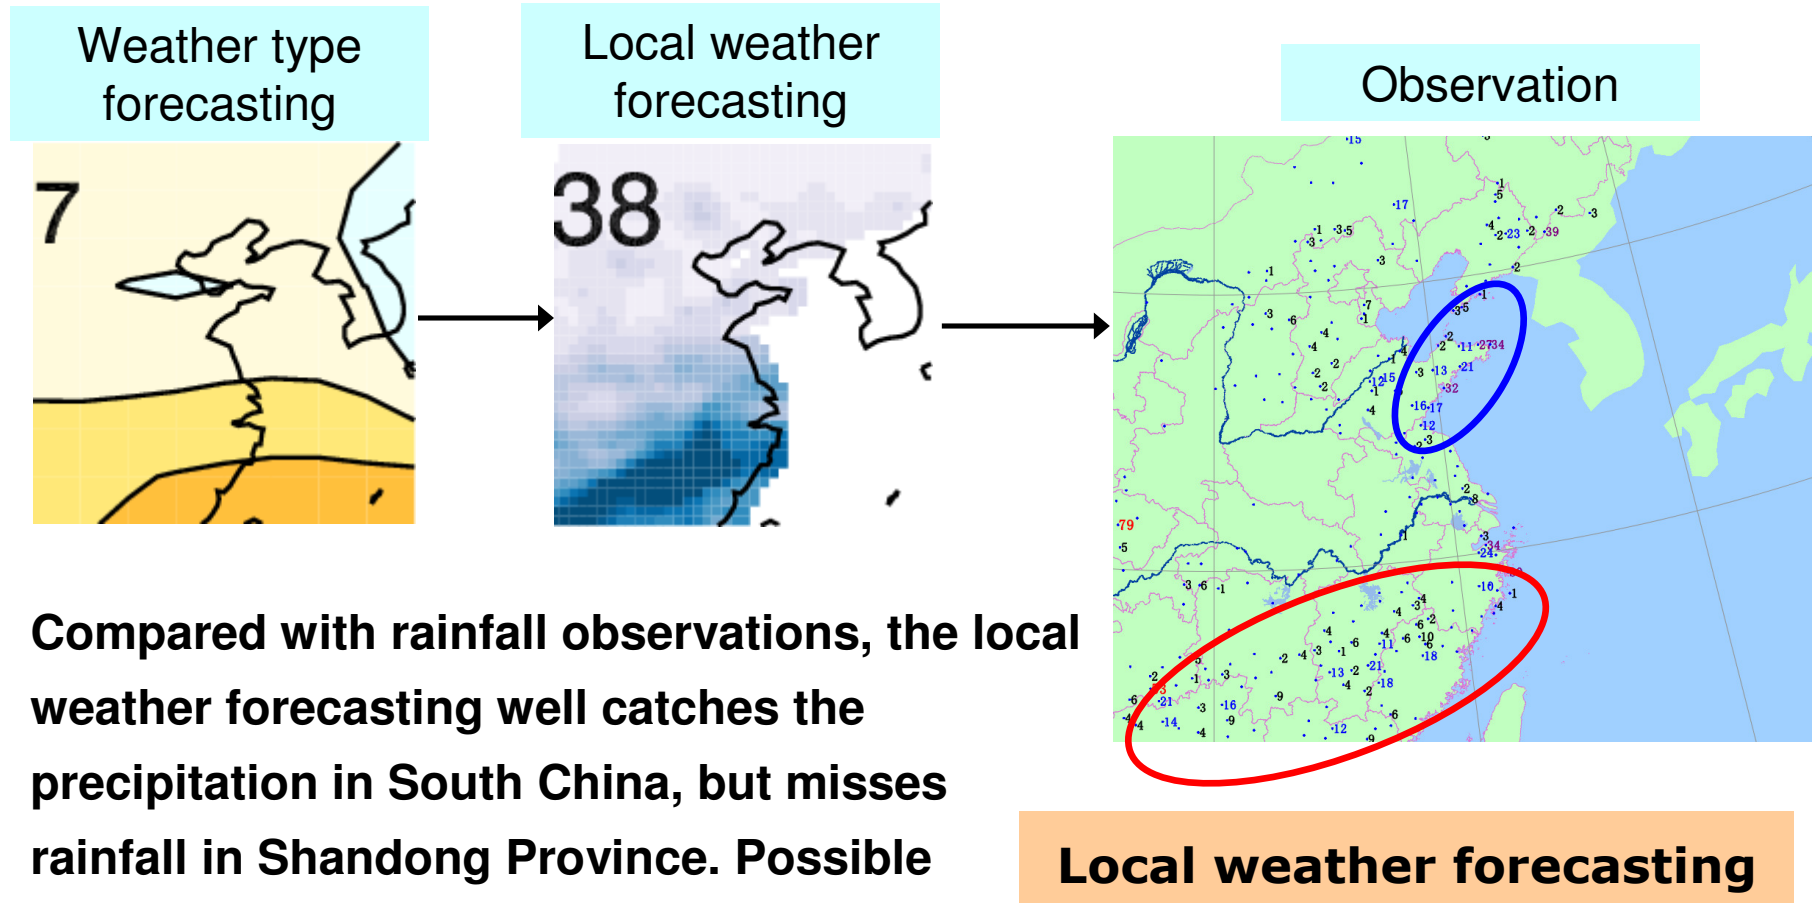

Verify the 144h weather-type-identification forecast

### 3.3 Identification of Typical Weather Events in Summer over China

### 3.3 Identification of Typical Weather Events in Summer over China

**Compared with rainfall observations, the local weather forecasting well catches the precipitation in South China, but misses rainfall in Shandong Province. Possible reasons are the precipitation is not only influenced by 500mb height, also by other factors, such as wind and moisture.**

**Local weather forecasting**

## 4 Future Plan

---

- ❑ Operational application of research result
- ❑ Issue the medium range probability forecast by the end of 2010
- ❑ Further research on improving HIW forecast skill based on EPS

Thank You!
