Update: August 9 2018

# FV3 Dycore and Global Models

## *GFS (Deterministic)*

- March 2018: Real Time FV3GFS Beta Version
  - C768L64 (~13km)
  - GFDL MP
- Q1-Q2 2019: Implement FV3GFS Beta Version

## *GEFS (Ensemble) v12*

- Configuration
  - C384L64 (~25km)
  - 31 members, 4 cycles/day, out to 16 days
  - Extend 35 days forecast at 00UTC
- Q3FY18: Start to produce 20 years (1999-2018) reanalysis
- Q4FY18: Start to produce 30 years (1989-2018) reforecast
- Q2FY19: Start to produce retrospective runs (2.5 years)
- Q3FY19: Start users evaluation
- **Q2FY20: Implement FV3GEFS operational version (v12)**

# FV3-GEFS experiments for weather

Bing Fu, Kate Zhou

- Resolution – C384 (~25km)
- **Lead time – 16 days**
- Ensemble members – 20 perturbed + 1 control
- Summer period:
  - Jun. 1 2017 – Aug. 6 2017 (67 cases)
- Winter period:
  - Dec. 1 2017 – Jan. 31 2018 (62 cases)
- Model and initial perturbations
  - Latest version with all bugs fixed
  - GFS physics with GFDL MP
  - NSST – assimilate diurnal variation
  - **EnKF f06 for ensemble initial perturbation (FV3 GFS retrospective)**
- Sciences
  - Three stochastic schemes (SKEB, SPPT and SHUM)
  - 2-tier SST
  - New SA convective parameterization scheme

# Summer Verification

# Summary (8/8/2018)

- Summer 2+ months (67 cases) full testing (6/1 – 8/6/2017) for 16 days forecast, after full fixed all bugs we have found.
- NH 500hPa height
  - Good for all lead time, and week-2 as well, especially for CRPS
  - Good spread (and distribution), but question for day-1 Talagrand
- NH 850hPa temperature
  - It is good for all lead-time in terms of skills, spread, and uncertainty distribution, and bias.
- NH zonal winds (850hPa and 250hPa)
  - It is very good
- Tropical zonal winds (850hPa and 250hPa)
  - It is good in terms of error
  - **Concern : large spread or over-dispersion for lower level (mainly).**
- **Precipitation**
  - **It has supper improvement from current operation.**
  - **Especially for reliability – much enhanced spread**
  - **Due to “new stochastic scheme”, GFDL MP and others (?)**
- Hurricane tracks
  - One case (Harvey) only, it is better than initialized through operation analysis
  - Good track prediction on 8/23/2018 ooUTC

# Summary (8/8/2018)

- Winter 2 months (62 cases) full testing (12/1/2017 – 1/31/2018) for 16 days forecast, after full fixed all bugs we have found.
- NH 500hPa height
  - Good for all lead time, and week-2 as well, especially for CRPS
  - Significant better than opr for 1<sup>st</sup> week, but not as good as summer, especially for week-2
- NH 850hPa temperature
  - It is good for all lead-time in terms of skills, spread, and uncertainty distribution, and bias. Less significant for week-2
- NH zonal winds (850hPa and 250hPa)
  - It is very good
- Tropical zonal winds (850hPa and 250hPa)
  - It is good in terms of error
  - **Concern : large spread or over-dispersion for lower level (mainly).**
- **Precipitation**
  - **It is much better than current operation, but not as good as summer**
  - **Especially for reliability – much enhanced spread**
  - **Due to “new stochastic scheme”, GFDL MP and others (?)**
- Drop out case
  - Jan 16 2018 00UTC – much degraded skill score after 3-4 days. This score (and previous couple of days) greatly impact week-2

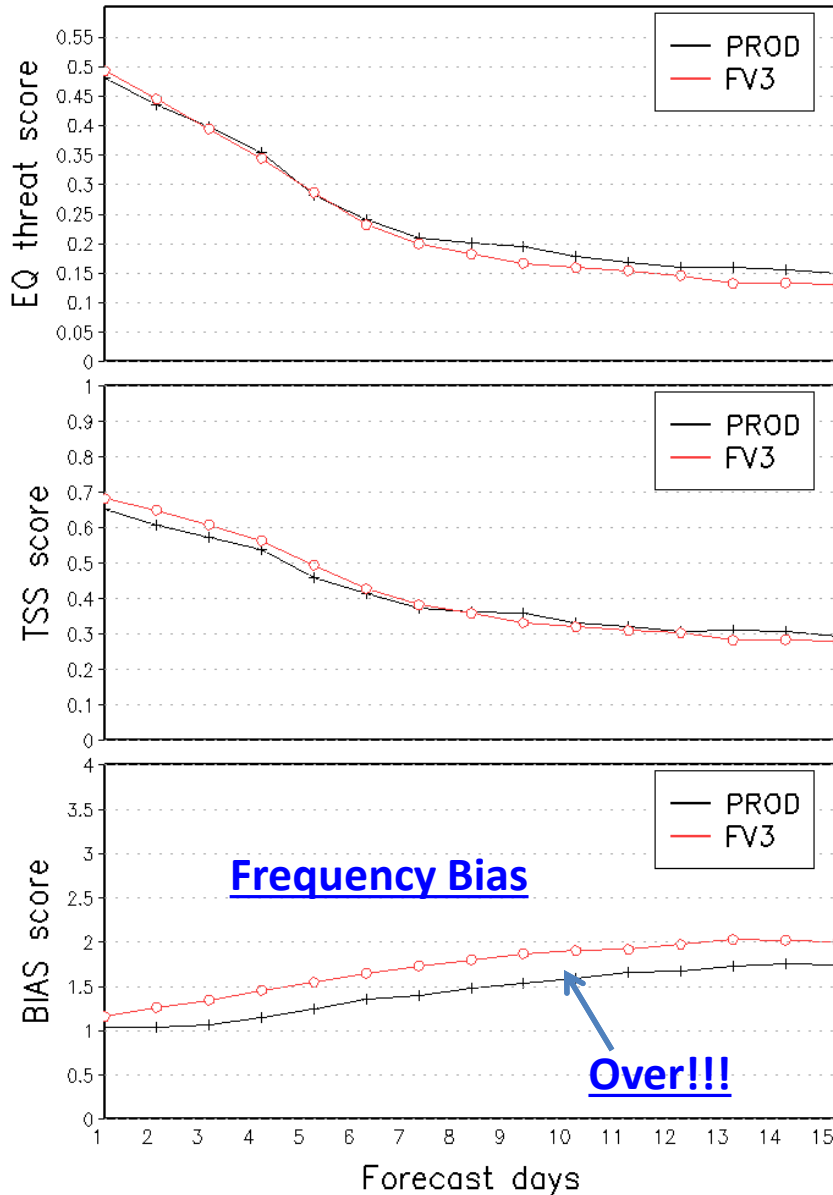

# Concerns and/or Issues

- **Tropical over-dispersion for winds**
  - Indicated for all vertical levels, lower level has more, and high level has less
  - Walter has run experiments on thiea (without 2-tiered SST, and not use FV3 retrospective analysis) which shows the similar conclusion.
  - Walter experiments indicate that either reduces 20% SPPT or turn out SHUM will limit over-dispersion for tropical without significant impact for extra-tropical area, but will look at the impact of the precipitation and tropical storm (later).
- **Stability of GEFS**
  - Bing Fu has found another re-produced crash case for C384 GEFS – one member failed after nearly 16 days integration
  - It happens after previous bug fixed (Jongil)
  - Looks there is a different issue – no clear clue yet
  - Bing Fu can not reproduce this failed case on thiea, therefore, Phil will not be able to jump
  - **Good news - No more crashed case since last one**
- **Precipitation forecast**
  - **For >1.0 mm (all precipitation categories), looks both of summer and winter are less biased, but it still has spread issue**
  - For >5mm and greater threads, both of spread and bias are much better.
